

# LMC7101 Tiny Low Power Operational Amplifier with Rail-To-Rail Input and Output

### **General Description**

The LMC7101 is a high performance CMOS operational amplifier available in the space saving SOT 23-5 Tiny package. This makes the LMC7101 ideal for space and weight critical designs. The performance is similar to a single amplifier of the LMC6482/4 type, with rail-to-rail input and output, high open loop gain, low distortion, and low supply currents.

The main benefits of the Tiny package are most apparent in small portable electronic devices, such as mobile phones, pagers, notebook computers, personal digital assistants, and PCMCIA cards. The tiny amplifiers can be placed on a board where they are needed, simplifying board layout.

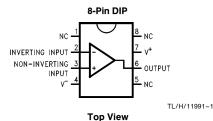

#### **Features**

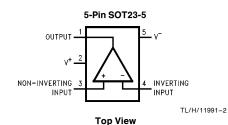

- Tiny SOT23-5 package saves space—typical circuit layouts take half the space of SO-8 designs
- Guaranteed specs at 2.7V, 3V, 5V, 15V supplies
- Typical supply current 0.5 mA at 5V
- Typical total harmonic distortion of 0.01% at 5V
- 1.0 MHz gain-bandwidth
- Similar to popular LMC6482/4
- Input common-mode range includes V<sup>-</sup> and V<sup>+</sup>
- Tiny package outside dimensions—120 x 118 x 56 mils, 3.05 x 3.00 x 1.43 mm

### **Applications**

- Mobile communications
- Notebooks and PDAs
- Battery powered products
- Sensor interface

Note 1: Absolute Maximum Ratings indicate limits beyond which damage to the device may occur. Operating Ratings indicate conditions for which the device is intended to be functional, but specific performance is not guaranteed. For guaranteed specifications and the test conditions, see the Electrical Characteristics.

Note 2: Human body model, 1.5 k $\Omega$  in series with 100 pF.

Note 3: Applies to both single-supply and split-supply operation. Continuous short operation at elevated ambient temperature can result in exceeding the maximum allowed junction temperature at 150°C.

Note 4: The maximum power dissipation is a function of  $T_{J(max)}$ ,  $\theta_{JA}$  and  $T_A$ . The maximum allowable power dissipation at any ambient temperature is PD =  $(T_{J(max)} - T_A)/\theta_{JA}$ . All numbers apply for packages soldered directly into a PC board.

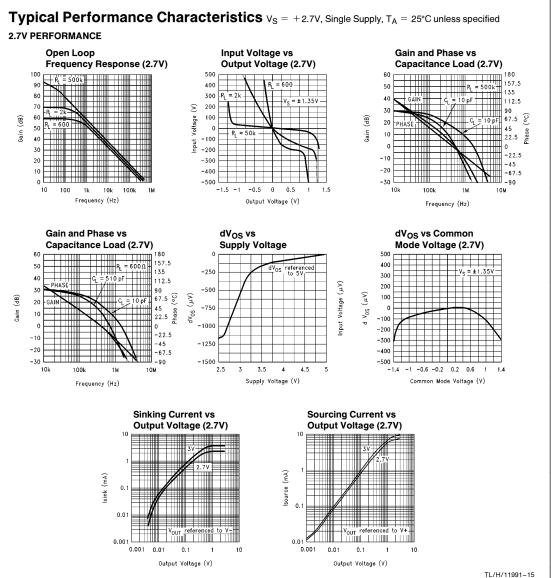

Note 5: Typical Values represent the most likely parametric norm.

Note 6: All limits are guaranteed by testing or statistical analysis.

Note 7: V  $^+$  = 15V, V<sub>CM</sub> = 1.5V and R<sub>L</sub> connect to 7.5V. For Sourcing tests, 7.5V  $\leq$  V<sub>O</sub>  $\leq$  12.5V. For Sinking tests, 2.5V  $\leq$  V<sub>O</sub>  $\leq$  7.5V.

Note 8:  $V^+=15V$ . Connected as a Voltage Follower with a 10V step input. Number specified is the slower of the positive and negative slew rates.  $R_L=100~k\Omega$  connected to 7.5V. Amp excited with 1 kHz to produce  $V_O=10~V_{PP}$ .

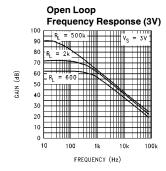

Note 9: Do not short circuit output to V+ when V+ is greater than 12V or reliability will be adversely affected.

### **Application Information**

# 1.0 Benefits of the LMC7101 Tiny Amp

**Size.** The small footprint of the SOT 23-5 packaged Tiny amp,  $(0.120 \times 0.118 \text{ inches}, 3.05 \times 3.00 \text{ mm})$  saves space on printed circuit boards, and enable the design of smaller electronic products. Because they are easier to carry, many customers prefer smaller and lighter products.

**Height.** The height (0.056 inches, 1.43 mm) of the Tiny amp makes it possible to use it in PCMCIA type III cards.

Signal Integrity. Signals can pick up noise between the signal source and the amplifier. By using a physically smaller amplifier package, the Tiny amp can be placed closer to the signal source, reducing noise pickup and increasing signal integrity. The Tiny amp can also be placed next to the signal destination, such as a buffer for the reference of an analog to digital converter.

Simplified Board Layout. The Tiny amp can simplify board layout in several ways. First, by placing an amp where amps are needed, instead of routing signals to a dual or quad device, long pc traces may be avoided.

By using multiple Tiny amps instead of duals or quads, complex signal routing and possibly crosstalk can be reduced.

**DIPs available for prototyping.** LMC7101 amplifiers packaged in conventional 8-pin dip packages can be used for prototyping and evaluation without the need to use surface mounting in early project stages.

**Tapes of ten for prototyping.** The SOT23-5 packaged devices are available in convenient and economical ten unit tapes for prototypes, evaluation, and small production runs.

**Low THD.** The high open loop gain of the LMC7101 amp allows it to achieve very low audio distortion—typically 0.01% at 10 kHz with a 10 k $\Omega$  load at 5V supplies. This makes the Tiny an excellent for audio, modems, and low frequency signal processing.

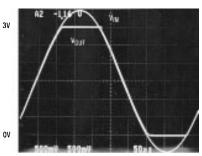

**Low Supply Current.** The typical 0.5 mA supply current of the LMC7101 extends battery life in portable applications, and may allow the reduction of the size of batteries in some applications.

**Wide Voltage Range.** The LMC7101 is characterized at 15V, 5V and 3V. Performance data is provided at these popular voltages. This wide voltage range makes the LMC7101 a good choice for devices where the voltage may vary over the life of the batteries.

# 2.0 Input Common Mode Voltage Range

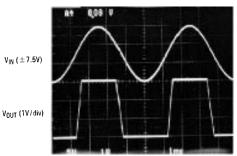

The LMC7101 does not exhibit phase inversion when an input voltage exceeds the negative supply voltage. *Figure 1* shows an input voltage exceeding both supplies with no resulting phase inversion of the output.

The absolute maximum input voltage is 300 mV beyond either rail at room temperature. Voltages greatly exceeding this maximum rating, as in *Figure 2*, can cause excessive current to flow in or out of the input pins, adversely affecting reliability.

TL/H/11991-8

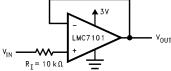

FIGURE 1. An Input Voltage Signal Exceeds the LMC7101 Power Supply Voltages with No Output Phase Inversion

TL/H/11991-9

FIGURE 2. A  $\pm$ 7.5V Input Signal Greatly Exceeds the 3V Supply in *Figure 3* Causing No Phase Inversion Due to R<sub>1</sub>

Applications that exceed this rating must externally limit the maximum input current to  $\pm 5$  mA with an input resistor as shown in Figure 3.

TL/H/11991-10

FIGURE 3. R<sub>I</sub> Input Current Protection for Voltages Exceeding the Supply Voltage

#### 3.0 Rail-To-Rail Output

The approximate output resistance of the LMC7101 is 180 $\Omega$  sourcing and 130 $\Omega$  sinking at V<sub>S</sub> = 3V and 110 $\Omega$  sourcing and 80 $\Omega$  sinking at V<sub>S</sub> = 5V. Using the calculated output resistance, maximum output voltage swing can be estimated as a function of load.

### 4.0 Capacitive Load Tolerance

The LMC7101 can typically directly drive a 100 pF load with  $V_{\rm S}=15V$  at unity gain without oscillating. The unity gain follower is the most sensitive configuration. Direct capacitive loading reduces the phase margin of op-amps. The combination of the op-amp's output impedance and the capacitive load induces phase lag. This results in either an underdamped pulse response or oscillation.

Capacitive load compensation can be accomplished using resistive isolation as shown in *Figure 4*. This simple technique is useful for isolating the capacitive input of multiplexers and A/D converters.

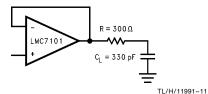

FIGURE 4. Resistive Isolation of a 330 pF Capacitive Load

### 5.0 Compensating for Input Capacitance when Using Large Value Feedback Resistors

When using very large value feedback resistors, (usually  $>500\,k\Omega)$  the large feed back resistance can react with the input capacitance due to transducers, photodiodes, and circuit board parasitics to reduce phase margins.

The effect of input capacitance can be compensated for by adding a feedback capacitor. The feedback capacitor (as in Figure 5),  $C_f$  is first estimated by:

$$\frac{1}{2\pi R_1 C_{IN}} \ge \frac{1}{2\pi R_2 C_f}$$

 $R_1\,C_{IN} \leq R_2\,C_f$  which typically provides significant overcompensation.

Printed circuit board stray capacitance may be larger or smaller than that of a breadboard, so the actual optimum value for  $C_{\text{F}}$  may be different. The values of  $C_{\text{F}}$  should be checked on the actual circuit. (Refer to the LMC660 quad CMOS amplifier data sheet for a more detailed discussion.)

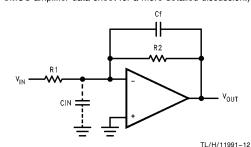

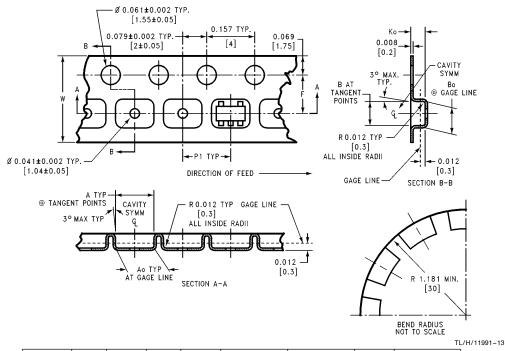

FIGURE 5. Cancelling the Effect of Input Capacitance

### **6.0 SPICE Macromodel**

A SPICE macromodel is available for the LMC7101. This model includes simulation of:

- Input common-mode voltage range
- Frequency and transient response
- GBW dependence on loading conditions
- Quiescent and dynamic supply current
- Output swing dependence on loading conditions and many more characteristics as listed on the macro model disk. Contact your local National Semiconductor sales office to obtain an operational amplifier spice model library disk.

#### LIFE SUPPORT POLICY

NATIONAL'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS WRITTEN APPROVAL OF THE PRESIDENT OF NATIONAL SEMICONDUCTOR CORPORATION. As used herein:

- 1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body, or (b) support or sustain life, and whose failure to perform, when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury to the user.
- A critical component is any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.
